

THE INVESTMENT THESIS

Understand the *chain reaction.*

An interactive world model of financial markets, starting with how participant constraints transmit shocks into portfolio risk.

SHOCK	>	CONSTRAINT	>	RESPONSE	>	OUTCOME
Market reprices		A limit is crossed		Exposures change		Portfolio is affected

A recurring decision

Initial buyer hypothesis: an APAC investment team with concentrated US equity and ETF exposure. Help a portfolio manager or risk lead prepare a defensible event-risk discussion.

An inspectable product

Authorized holdings + a dated scenario. Compare simple baselines with explicit participant responses, vary assumptions and retain a reproducible analysis trail.

Commercial path

A bounded six-week pilot, testing a US\$5,000 price, then annual team subscriptions. Platform licenses and usage-based APIs follow repeatable delivery. Pricing and willingness to pay are unvalidated.

Evidence today

A working synthetic browser demo, earlier research code and evaluation designs. No validated real-market edge, paid customers, committed pilots, production platform or committed investment.

The founding team

HongJin He / CTO - HKUST RMBI, mathematics & AI; technical vision and product.

Shuyao Xu / CEO - NUS EE & CS; company execution.

Liu YiNan / CFO - HKU finance & physics; commercial and capital planning.

Founder-reported backgrounds and roles; no university endorsement. The venture is currently founder-reported as unincorporated and unfunded.

The question for an early partner: what evidence should the first capital commitment buy?

CAPITAL FOLLOWS EVIDENCE

Fund the next proof.

US\$5m financing ambition for an 18-month program. Initial check size, valuation and terms are unset. A smaller first close requires a narrower funded plan.

01 Angel / first 90 days

Secure data rights. Freeze baselines and held-out evaluation. Calibrate a bounded engine, run ablations and uncertainty analysis, and seek independent technical review.

02 Seed / months 3-18

Run authorized shadow pilots. Test repeated use, paid conversion and renewal. Build reliable workspace delivery and selective APIs only after the workflow repeats.

03 Beyond seed / world-model research

Study adaptive populations, changing constraints and cross-market interactions. Expand toward intervention-based exploration with uncertainty and out-of-domain warnings.

18-month allocation scenario

Core talent	US\$1.80m	Release criteria A proposed scientific gate is at least 5% lower held-out quantile loss than the strongest preregistered simple baseline, with a paired 95% interval supporting improvement. This is not an achieved result. No reliable mechanism gain: narrow the claim. No paid demand: revisit the buyer. No repeatability: pause platform expansion.
Data and rights	US\$0.70m	
Compute	US\$0.65m	
Product and security	US\$0.45m	
Pilots	US\$0.40m	
Legal and operations	US\$0.30m	
Contingency	US\$0.70m	

Total planning envelope	US\$5.00m
--------------------------------	------------------

Allocations and timelines are planning assumptions, not quotes or commitments. Data rights, hiring, compute and delivery costs need current quotations; spending follows committed cash and evidence gates.

For a founder discussion, reply to the person who shared this brief and ask for HongJin.
Problem evidence: Bank of England, 2024 system-wide exploratory scenario final report.
